

# AN INTRODUCTION TO CYBERSECURITY INFORMATION SHARING

## MISP - THREAT SHARING

CIRCL / TEAM MISP PROJECT

MISP PROJECT

<https://www.misp-project.org/>

UNIVERSITY METZ

**MISP**  
Threat Sharing

- Agenda and details available  
<https://link.infini.fr/metz-training>

- During a malware analysis workgroup in 2012, we discovered that we worked on the analysis of the same malware.
- We wanted to share information in an easy and automated way **to avoid duplication of work.**
- Christophe Vandeplass (then working at the CERT for the Belgian MoD) showed us his work on a platform that later became MISP.
- A first version of the MISP Platform was used by the MALWG and **the increasing feedback of users** helped us to build an improved platform.
- MISP is now **a community-driven development.**

The Computer Incident Response Center Luxembourg (CIRCL) is a government-driven initiative designed to provide a systematic response facility to computer security threats and incidents. CIRCL is the CERT for the private sector, communes and non-governmental entities in Luxembourg and is operated by [securitymadein.lu](http://securitymadein.lu) g.i.e.

- CIRCL is mandated by the Ministry of Economy and acting as the Luxembourg National CERT for private sector.
- CIRCL leads the development of the Open Source MISP threat intelligence platform which is used by many military or intelligence communities, private companies, financial sector, National CERTs and LEAs globally.
- **CIRCL runs multiple large MISP communities performing active daily threat-intelligence sharing.**

**Co-financed by the European Union**

Connecting Europe Facility

# WHAT IS MISP?

- MISP is a **threat information sharing** platform that is free & open source software
- A tool that **collects** information from partners, your analysts, your tools, feeds
- Normalises, **correlates, enriches** the data
- Allows teams and communities to **collaborate**
- **Feeds** automated protective tools and analyst tools with the output

- There are many different types of users of an information sharing platform like MISP:
  - ▶ **Malware reversers** willing to share indicators of analysis with respective colleagues.
  - ▶ **Security analysts** searching, validating and using indicators in operational security.
  - ▶ **Intelligence analysts** gathering information about specific adversary groups.
  - ▶ **Law-enforcement** relying on indicators to support or bootstrap their DFIR cases.
  - ▶ **Risk analysis teams** willing to know about the new threats, likelihood and occurrences.
  - ▶ **Fraud analysts** willing to share financial indicators to detect financial frauds.

# MISP MODEL OF GOVERNANCE

- Sharing indicators for a **detection** matter.
  - ▶ 'Do I have infected systems in my infrastructure or the ones I operate?'
- Sharing indicators to **block**.
  - ▶ 'I use these attributes to block, sinkhole or divert traffic.'
- Sharing indicators to **perform intelligence**.
  - ▶ 'Gathering information about campaigns and attacks. Are they related? Who is targeting me? Who are the adversaries?'
- → These objectives can be conflicting (e.g. False-positives have different impacts)

# COMMUNITIES USING MISP

- Communities are groups of users sharing within a set of common objectives/values.
- CIRCL operates multiple MISP instances with a significant user base (more than 1200 organizations with more than 4000 users).
- **Trusted groups** running MISP communities in island mode (air gapped system) or partially connected mode.
- **Financial sector** (banks, ISACs, payment processing organizations) use MISP as a sharing mechanism.
- **Military and international organizations** (NATO, military CSIRTs, n/g CERTs,...).
- **Security vendors** running their own communities (e.g. Fidelis) or interfacing with MISP communities (e.g. OTX).
- **Topical communities** set up to tackle individual specific issues (COVID-19 MISP)

- Sharing difficulties are not really technical issues but often it's a matter of **social interactions** (e.g. **trust**).
- Legal restriction<sup>1</sup>
  - ▶ "Our legal framework doesn't allow us to share information."
  - ▶ "Risk of information-leak is too high and it's too risky for our organization or partners."
- Practical restriction
  - ▶ "We don't have information to share."
  - ▶ "We don't have time to process or contribute indicators."
  - ▶ "Our model of classification doesn't fit your model."
  - ▶ "Tools for sharing information are tied to a specific format, we use a different one."

---

<sup>1</sup><https://www.misp-project.org/compliance/>

# MISP PROJECT OVERVIEW

# GETTING SOME NAMING CONVENTIONS OUT OF THE WAY...

## ■ Data layer

- ▶ **Events** are encapsulations for contextually linked information
- ▶ **Attributes** are individual data points, which can be indicators or supporting data
- ▶ **Objects** are custom templated Attribute compositions
- ▶ **Object references** are the relationships between other building blocks
- ▶ **Sightings** are time-specific occurrences of a given data-point detected

## ■ Context layer

- ▶ **Tags** are labels attached to events/attributes and can come from **Taxonomies**
- ▶ **Galaxy-clusters** are knowledge base items used to label events/attributes and come from **Galaxies**
- ▶ **Cluster relationships** denote pre-defined relationships between clusters

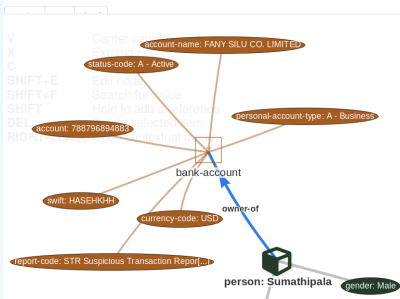

- Indicators<sup>2</sup>
  - ▶ Indicators contain a pattern that can be used to detect suspicious or malicious cyber activity.
- Attributes in MISP can be network indicators (e.g. IP address), system indicators (e.g. a string in memory) or even bank account details.
  - ▶ **A type (e.g. MD5, url) is how an attribute is described.**
  - ▶ An attribute is always in a category (e.g. Payload delivery) which puts it in a context.
    - **A category is what describes** an attribute.
  - ▶ An IDS flag on an attribute allows to determine if **an attribute can be automatically used for detection.**

---

<sup>2</sup>IoC (Indicator of Compromise) is a subset of indicators

# A RICH DATA-MODEL: TELLING STORIES VIA RELATIONSHIPS

	Space after Filename	Change Default File	Launch Daemon	Hidden Window	Keychain	System Service Discovery	Third-party Software	Automated Collection		Data Encoding

- Sharing via distribution lists - **Sharing groups**
- **Delegation** for pseudo-anonymised information sharing
- **Proposals** and **Extended events** for collaborated information sharing
- Synchronisation, Feed system, air-gapped sharing
- User defined **filtered sharing** for all the above mentioned methods
- Cross-instance information **caching** for quick lookups of large data-sets
- Support for multi-MISP internal enclaves

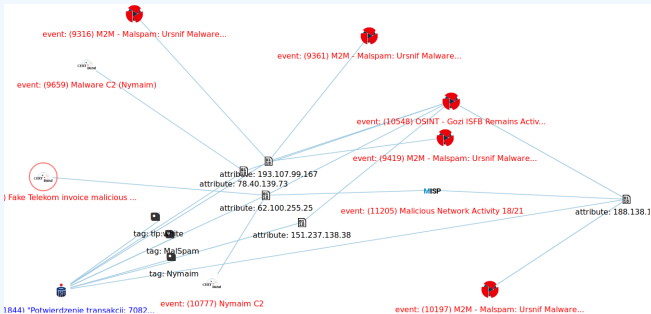

# MISP CORE DISTRIBUTED SHARING FUNCTIONALITY

- MISPs' core functionality is sharing where everyone can be a consumer and/or a contributor/producer."
- Quick benefit without the obligation to contribute.
- Low barrier access to get acquainted to the system.

- Correlating data
- Feedback loop from detections via **Sightings**
- **False positive management** via the warninglist system
- **Enrichment system** via MISP-modules
- **Integrations** with a plethora of tools and formats
- Flexible **API** and support **libraries** such as PyMISP to ease integration
- **Timelines** and giving information a temporal context
- Full chain for **indicator life-cycle management**

# CORRELATION FEATURES: A TOOL FOR ANALYSTS

- To corroborate a finding (e.g. is this the same campaign?), reinforce an analysis (e.g. do other analysts have the same hypothesis?), confirm a specific aspect (e.g. are the sinkhole IP addresses used for one campaign?) or just find if this threat is new or unknown in your community.

# SIGHTINGS SUPPORT

The screenshot displays the SightingDB interface. At the top, there is a table of events with columns for status, sighting status, and inheritance. A tooltip for a sighting shows the following details:

- Sightings**
- CIRCL: 2 (2017-03-19 16:17:59)**
- Score: (2/0/0)
- Score: (0/0/0)

Below the table, there is a 'Tags' section with a '+' icon. The main details section includes:

- Date:** 2016-02-24
- Threat Level:** High
- Analysis:** Initial
- Distribution:** Connected communities
- Sighting Details:** No
- MISP: 2**
- CIRCL: 2**
- Discussion:** 4 (2) - restricted to own organisation only.

- Has a data-point been **sighted** by me or the community before?
- Additionally, the sighting system supports negative sightings (FP) and expiration sightings.
- Sightings can be performed via the API or the UI.
- Many use-cases for **scoring indicators** based on users sighting.
- For large quantities of data, **SightingDB** by Devo

# TIMELINES AND GIVING INFORMATION A TEMPORAL CONTEXT

- Recently introduced **first\_seen** and **last\_seen** data points
- All data-points can be placed in time
- Enables the **visualisation** and **adjustment** of indicators timeframes

# LIFE-CYCLE MANAGEMENT VIA DECAYING OF INDICATORS

The screenshot displays a web interface for managing indicators. At the top, there are navigation tabs: "Photos", "Galaxy", "Event graph", "Correlation graph", "ATTACK matrix", "Attributes", and "Discussion". Below these is a search bar containing "45: Decay...". A "Galaxies" section is visible with a search icon and a plus sign. Below that are navigation buttons: "previous", "next >", and "view all".

The main content is a table with columns: "Date", "Org", "Category", "Type", "Value", "Tags", "Galaxies", "Comment", "Correlate", "Related Events", "Feed hits", "IDS", "Distribution", "Sightings", "Activity", "Score", and "Actions". The table contains five rows of data, each representing an indicator. The "Score" column shows values like 65.26, 79.88, 54.6, 52.69, 37.43, 37.41, and 23.31. Each row has a "Decay score" toggle button (a circle with a plus sign) and a "Model 5" button. The "Score" column also has a "NIDS Simple Decaying ..." button. The "Activity" column shows a line graph for each indicator.

Date	Org	Category	Type	Value	Tags	Galaxies	Comment	Correlate	Related Events	Feed hits	IDS	Distribution	Sightings	Activity	Score	Actions
2019-09-12		Network activity	ip-src	5.5.5.5								Inherit	(0/0)		65.26	
2019-08-13		Network activity	ip-src	8.8.8.8	adm_rality_scale:source-reliability="A" x retention:expired x				1 2 2 2 Show S1.1 S1.2 11 more...			Inherit	(5/0)		79.88	
2019-08-13		Network activity	ip-src	9.9.9.9	adm_rality_scale:source-reliability="C" x msp:confidence-level="completely-confident" x Ipnumber				1 3 1 9 Show S1.1 28 more...			Inherit	(4/1)		54.6	
2019-08-13		Network activity	ip-src	7.7.7.7	adm_rality_scale:information-credibility="4" x retention:20 x				41			Inherit	(3/0)		52.69	
2019-07-18		Network activity	ip-src	6.6.6.6					41			Inherit	(0/0)		37.43

Simulate Attributes with different Models

- We maintain the default CIRCL OSINT feeds (TLP:WHITE selected from our communities) in MISP to allow users to ease their bootstrapping.
- The format of the OSINT feed is based on standard MISP JSON output pulled from a remote TLS/HTTP server.
- Additional content providers can provide their own MISP feeds. (<https://botvrij.eu/>)
- Allows users to **test their MISP installations and synchronisation with a real dataset.**
- Opening contribution to other threat intel feeds but also allowing the analysis of overlapping data<sup>3</sup>.

---

<sup>3</sup>A recurring challenge in information sharing

- **Information sharing practices come from usage** and by example (e.g. learning by imitation from the shared information).
- MISIP is just a tool. What matters is your sharing practices. The tool should be as transparent as possible to support you.
- Enable users to customize MISIP to meet their community's use-cases.
- MISIP project combines open source software, open standards, best practices and communities to make information sharing a reality.
